

My Project №1 [WebCrypt = free version](#)

File Encryption

26.12.24, 20:27

WEBCRYPT 2025

Encrypt a File

Select File:

Choose File no file selected

Enter Password:

ENCRYPT

Decrypt a File

Select Encrypted File:

Choose File no file selected

Enter Password:

DECRYPT

How the Website "WebCrypt" works?

File Encryption: The user uploads a file through the form on the website. A password is entered for encryption. The file is converted into a Base64 string (to handle the file data as text). The website uses the CryptoJS library to encrypt the Base64 string using the AES (Advanced Encryption Standard) algorithm. The encrypted output is saved as a new file with the .enc extension and downloaded by the user.

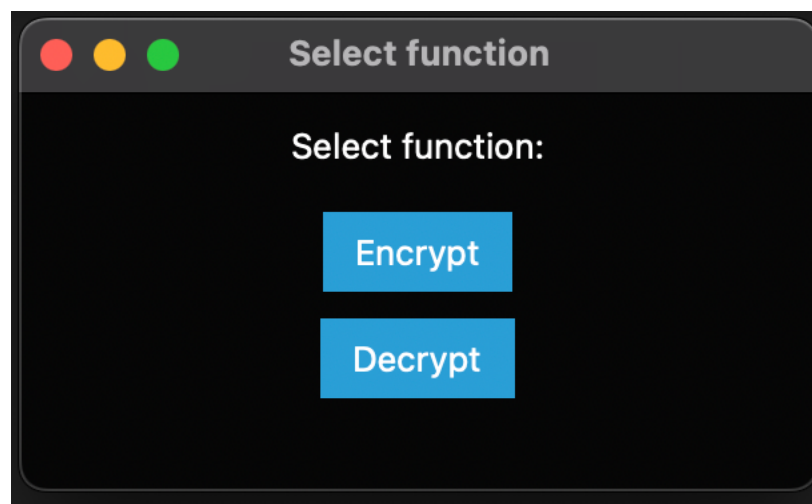

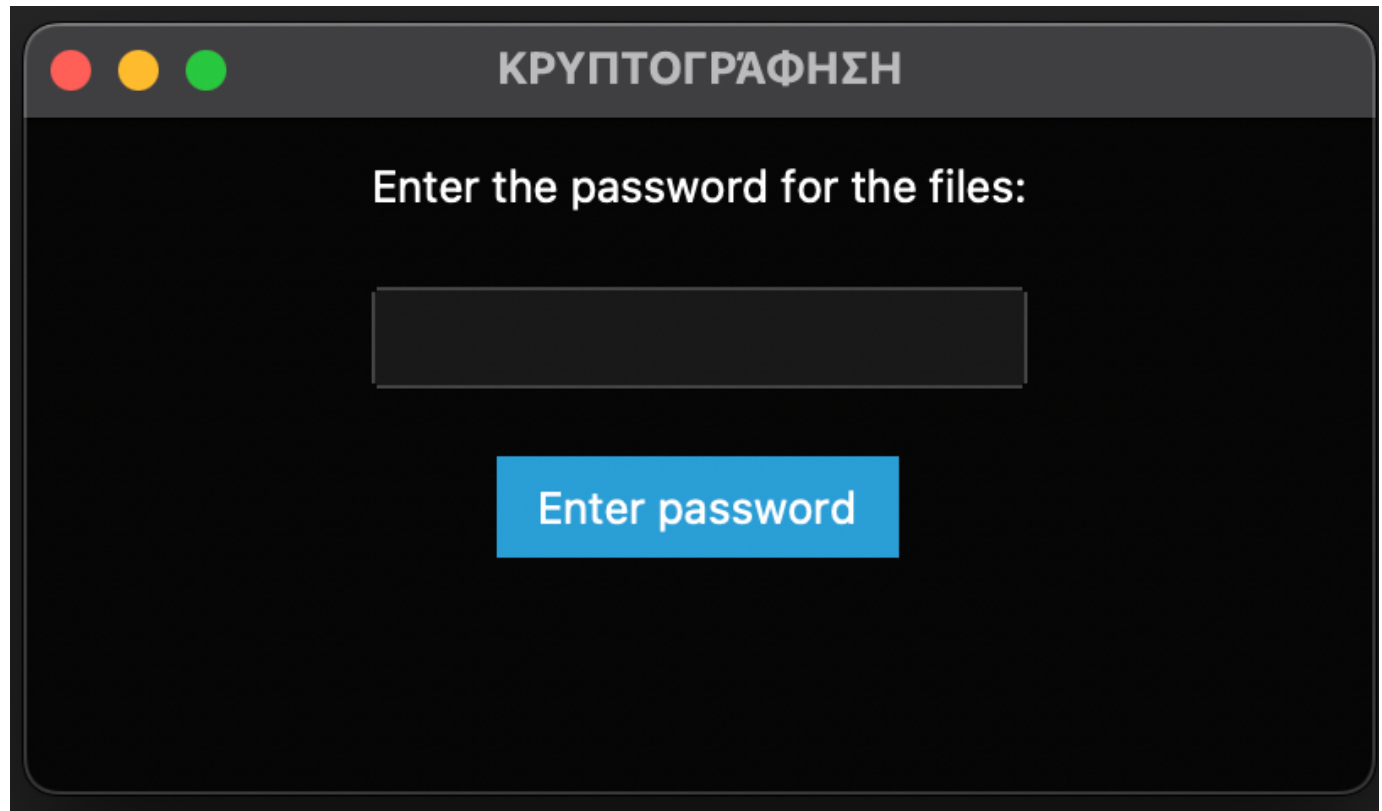

Encryption Details Encryption Algorithm: AES (using a secret key derived from the password).

File Decryption: The user uploads an encrypted file and provides the password. The website decrypts the file using the same AES algorithm. The decrypted data is converted back from Base64 to its original binary format. The user can then download the restored file.

Process: The password is transformed into an encryption key. The file data is encrypted using AES, producing a secure text-based string. The result is a protected .enc file that cannot be decrypted without the correct password. File Extension: Encrypted files are saved with the .enc extension to indicate their protected status. Advantages Ease of Use: Users only need to upload a file and enter a password.

Local Processing: All encryption and decryption operations are performed locally in the browser, ensuring that no data is sent to a server, which enhances security.

My Project №2 "OROS" Pro Version = \$corporate version

The programme is designed to encrypt large files of various types using the AES encryption algorithm with a key length of 256 bits and other special algorithms.

The programme does not need to be installed and its size does not exceed 20 megabytes.

OC: Windows, Linux, macOS.

My Project №3 planned in 2025
